

SMPS-T-01-1-120-DC24V-5A

## SMPS-T-01-1-120-DC24V-5A

The primary pulsed SMPS switch mode power supply is suitable for a wide range of automation applications in the machine building industry. As central unit of the DC 24 V level they can be used in combination with the 4230-T MCB for AC primary circuit protection. Thanks to the compact design it helps save space in the control cabinet. The 150 % power boost of the power supplies ensures increased machine uptime. Thanks to their mode options (continuous current/hiccup) and their wide output voltage range, they are suitable for a wide range of applications. Thanks to their flexible expandability, you can easily connect several power supplies in series, making future expansions possible without any problems.

### TYPICAL FEATURES

- Efficiency factor of more than 90 %
- only 35 mm wide aluminium enclosure
- 150 % overload
- Constant current or hiccup mode limitation, adjustable by the user
- Wide range of output voltage

### TYPICAL APPLICATIONS

Process engineering, e.g. industrial switch and control systems, machine building industry, telecommunication systems

### YOUR BENEFITS

- High efficiency and space-savings through compact design
- Increased machine uptime through 150 % power boost
- Flexible application area through mode selection (constant current/hiccup) and wide range of output voltage
- Flexibly expandable through facilitated connection of the power supplies in series

### COMPLIANCE

## GENERAL INFORMATION

### SAFETY AND INSTALLATION INSTRUCTIONS

Installation must be done by a qualified electrician.

- The device must only be supplied with power after proper installation.
- The user must ensure that the cable cross section complies with the applicable current rating. The national standards (e.g. for Germany DIN VDE 0100) must be observed for installation and selection of feed and return cables.
- Recommended circuit breaker for the primary input cable protection: E-T-A 4230 IN C4A circuit breaker
- In addition, special precautions must be taken in the system or machine (e.g. use of a safety PLC), which reliably prevent an automatic re-start of parts of the system (cf. Machinery Directive 2006/42/EU and EN 60204-1, Safety of Machinery). In the event of a failure (short circuit/overload) the load circuit is disconnected by the circuit breaker or the switch mode power supply.
